

Sensitise communities about environmental conservation

It's quite hard to believe that Uganda the Pearl of Africa is battling with drought. For the last 15 years, Uganda has experienced massive environment degradation, this includes but is not limited to destruction of swamps, forests, lakes, and rivers leading to weather changes. Instead of only arresting culprits of environment degradation, National Forest Authority should organise sensitisation campaigns to educate the populace about merits and demerits of environment

degradation.

Majority of our people degrade the environment out of ignorance.

It would have been very important for not only Uganda, but Africa as a whole, to copy from European countries which have adopted new policies on climate and environmental changes. These new policies include, planting man-made forests, fighting water hyacinth to preserve aqua life.

Ever since the projection of millennium development goals which

include environmental sustainability, the hottest debate in the Europe has been the changing patterns of climate or global warming, natural disasters, which are a clear indication that in a few years, climate will be one of the greatest enemies of human population. Its better, therefore, for our Parliament to review most of its plenary debates to consider climatic changes as our greatest threat.
