

## Robotics can motivate students to enjoy sciences

Many schools and universities are gradually embracing the teaching of robotics.

Apart from the associated benefits of robots in an economy, they also help students appreciate and enjoy the learning of science and technology.

At the time when the Government is aggressively promoting the studying and teaching of sciences in schools and universities, with the aim of supporting industrial growth; robotics is the right move to take.

Robotics in students take pride in coming up with innovations, which make a difference in life. It increases students' motivation by giving them hands-on application of the methods, theories and lessons discussed in math and science courses.

Every young person should possess knowledge in mathematics, science, technology and engineering

and be ready to use it in the real world.

The success of the country's industrial growth is deeply rooted in its ability to raise youth who are productive and not merely dependants.

We should provide students with new tools and techniques that enable them to learn, and to practice the knowledge they have acquired.

Private investors, the Government and community need to support the new ways of promoting science and technology education in the country.

This responsibility starts with all of us; since we all stand to lose on benefits.
